

Exercises: Auto Mapping Objects

This document defines the exercise assignments for the ["Spring Data" course @ SoftUni](#).

SoftUni Game Store

The game store is a platform, where users can buy games. Your task is to create a console application for the store.

Data Models

Create the required **entities**. Use appropriate **data types**.

- The system contains information about **users** and **games**.
- Users can **register** in the system. After successful registration, the user has **email**, **password**, **full name**, **list of games** and information on whether he/she is an **administrator** or **not**.
- The **first registered user** becomes also an **administrator**. You can manually mark users as admins in the database.
- A **game** has a **title**, **trailer** (YouTube Video Id), **image thumbnail** (URL), **size**, **price**, **description** and **release date**
- Users can make **orders**. Each order has a **single buyer (user)** and one or many products.

Functionality

- **All users** can view all games.
- **All users** can view the details of each game.
- **Logged-in users** can logout.
- **Logged in users** can add/remove games from their shopping cart.
- **Logged in users** can buy games that are added to the shopping cart and those games are added to the profile of the user and cannot be bought for a second time.
- **Administrators** can add, edit or delete games.
- Basic user **can not** add, edit or delete game.

1. Design the Database

Design **entity classes** and create a **database** to hold the **users**, **games** and **orders**.

2. Implement User Registration, Login and Logout

The guest users can register and log in.

- **RegisterUser|<email>|<password>|<confirmPassword>|<fullName>** - This command adds a new user to the database in case of valid parameters. Otherwise, prints an appropriate message informing why the user cannot be registered. The requirements for valid parameters are:
 - **Email** – must contain **@ sign** and a **period**. It must be unique.
 - **Password** – length must be **at least 6 symbols** and must contain at least **1 uppercase**, **1 lowercase** letter and **1 digit**.
 - **Confirm Password** – must **match** the provided password.
- **LoginUser|<email>|<password>** - This command sets the current logged in user if it exists. Otherwise, prints an appropriate message.

Logged in user can logout.

- **Logout** – This command logs out the user from the system. If there is no logged in user, print appropriate message.

Example

Input	Output
RegisterUser ivan@ivan.com Ivan12 Ivan12 Ivan	Ivan was registered
LoginUser ivan@ivan.com Ivan12	Successfully logged in Ivan
Logout	User Ivan successfully logged out
RegisterUser ivangmail.com Ivan12 Ivan12 Ivan	Incorrect email.
LoginUser ivan@ivan.com Ivan	Incorrect username / password
Logout	Cannot log out. No user was logged in.

3. Implement Managing Games

As an admin, you have the option to **add/edit/delete games to the catalog**.

- **AddGame|<title>|<price>|<size>|<trailer>|<thumbnailURL>|<description>|<releaseDate>**
- **EditGame|<id>|<values>** - A game should be edited in case of valid id. Otherwise, print appropriate message.

A game should be added/edited only to the catalog, if it matches the following criteria:

- **Title** – has to begin with an **uppercase letter** and must have length between **3 and 100 symbols** (inclusively).
- **Price** – must be a **positive number**.
- **Size** – must be a **positive number**.
- **Trailer** – only videos from YouTube are allowed. Only their **ID**, which is a string of exactly **11 characters**, should be saved to the database.
For example, if the URL to the trailer is **https://www.youtube.com/watch?v=edYCtaNueQY**, the required part that must be saved into the database is **edYCtaNueQY**. That would be always the last 11 characters from the provided URL.
- **Thumbnail URL** – it should be a plain text starting with **http://**, **https://**
- **Description** – must be at least 20 symbols
- **DeleteGame|<id>** - A game should be deleted in case of valid id. Otherwise, print an appropriate message.

Example

Input	Output
AddGame Overwatch 100.00 15.5 FqnKB22pOC0 https://us.battle.net/forums/static/images/social-thumbs/overwatch.png Overwatch is a team-based multiplayer online first-person shooter video game developed and published by Blizzard Entertainment. 24-05-2016 EditGame 1 price=80.00 size=12.0 DeleteGame 1	Added Overwatch Edited Overwatch Deleted Overwatch

4. Implement View Games

Implement a view for retrieving different information about the games.

- **AllGames** - print titles and price of all games.
- **DetailsGame|<gameTitle>** - print details for a single game.
- **OwnedGames** – print the games bought by the **currently logged in user**.
 - First you have to make a game purchase method from a user.

Example

Input	Output
AllGames	Overwatch 80.00 Assassin's Creed 70.00 Tomb Raider 80.00 ...
DetailGame Overwatch	Title: Overwatch Price: 80.00 Description: Overwatch is a team-based multiplayer online first-person shooter video game developed and published by Blizzard Entertainment. Release date: 24-05-2016
OwnedGames	Overwatch Assassin's Creed ...

5. Implement Shopping Cart*

Each user should be able to buy a game.

- **AddItem|<gameTitle>** - add game to shopping cart
- **RemoveItem|<gameTitle>** - remove game from shopping cart
- **BuyItem** – buy all games from shopping cart
 - A user can **buy** a game **only once**!
 - If he owns a game, he **shouldn't be able to add** it to the shopping cart.

Example

Input	Output
AddItem Overwatch	Overwatch added to cart.
RemoveItem Overwatch	Overwatch removed from cart.
AddItem Overwatch	Overwatch added to cart.
BuyItem	Successfully bought games: -Overwatch
